

WEB PROTECTION

Add Web Protection to your Managed Antivirus, Mail Protection, and Backup

- Keep your business safe and your end-users protected by securing against websites pushing malware, phishing, proxies, spyware, adware, botnets and spam
- Apply time-based browsing rules and web content filtering policies across a robust range of website categories, helping to reduce non-work related browsing such as social networking, auctions, games and more
- Help employees stay productive with common-sense web browsing policies designed for the workplace
- Stay on top of bandwidth usage with alerts when devices exceed thresholds - enabling quick remediation to avoid unwanted costs or a throttled network
- Protect the business from legal liability and reduce the risk of a security breach through proactive internet access controls

Here's how it works

The Web Protection Feature is built around a policy-driven approach, so that each device under our Web Protection will point to a central policy. We can edit the policy and adjust settings for your devices, allowing us to scale your web protection across a range of devices that best fits your security needs.

There's a ton of great policy options

- Block users from visiting suspected and confirmed unsafe sites
- Apply web filtering to enforce internet access policies in the workplace
- Set white lists and black lists to override category based filters
- Optionally apply a schedule so employees can access non-work sites during out of office hours or during the lunch hour
- Apply a 'web bandwidth' check and be alerted when there's excessive bandwidth activity on a network
- Intelligently filter internet activity by day, category and URL to reveal trends, spikes and irregularities and show or hide URL data depending on data privacy requirements
